We present a set of light curves of the eclipsing binary system AS Cam that were used for studies of its apsidal motion rate and light equation. This system was considered unusual during several decades, because its apsidal motion rate was estimated from observations as very slow in comparison with the theory. The presented light curves can be used for independent studies.

## 1 Introduction

Here we present light curves of the eclipsing variable AS Cam obtained from ground-based observations. These curves were studied in Khaliullin & Kozyreva (1983), Kozyreva & Khaliullin (1999), Kozyreva, Zakharov, & Khaliullin (1999), Kozyreva & Zakharov (2006a,b), Kozyreva, Kusakin & Bogomazov (2018), Kozyreva et al. (2021).

The main specific feature of AS Cam is the observationally estimated apsidal motion rate, found to be much less than the predicted theoretical value (Khaliullin & Kozyreva, 1983). A possible explanation is the presence of a third body in the system (Kozyreva & Khaliullin, 1999; Kozyreva, Zakharov, & Khaliullin, 1999).

The light curves presented in this paper can be used for independent studies.

## 2 Light curves

The light curves of AS Cam are presented in Table 1. Selected light curves are shown in Figures 1–19.

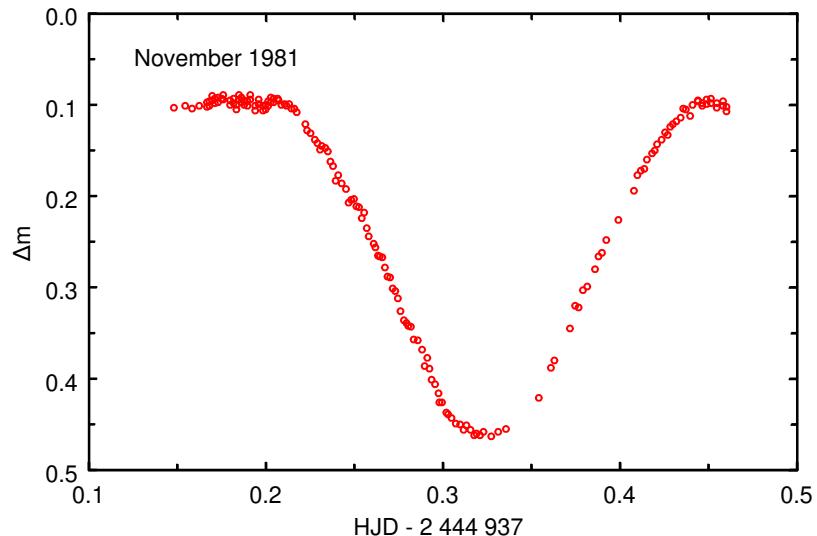

The table contains the differential magnitude of AS Cam,  $\Delta m$  (with HD 34463 used as the comparison star) in the  $V$  filter and  $\sigma$  (the standard deviation of  $\Delta m$ ) versus the heliocentric Julian date (HJD). Figures show the differential magnitude versus the HJD of the observation.

For further information about presented observations, see the above references.
