# АСТРОНОМИЧЕСКИЙ КАЛЕНДАРЬ

## 2031

выпуск двадцать седьмой  
(рабочая версия)

## Начало сезонов года

(по данным Fred Espenak - время всемирное)

**Весна - 20 марта, 19 ч 41 м** **Лето - 21 июня, 13 ч 17 м**  
**Осень - 23 сентября, 05 ч 15 м** **Зима - 22 декабря, 01 ч 56 м**  
*Земля в перигелии - 4 января 20 ч 48 м - 0.9832664 а.е.*  
*Земля в афелии - 6 июля 07 ч 10 м - 1.0166882 а.е.*

# АСТРОНОМИЧЕСКИЙ КАЛЕНДАРЬ НА 2031 ГОД

## СПРАВОЧНОЕ ИЗДАНИЕ

Серия «Астробиблиотека»

**Астрономический календарь на 2031 год**, составитель Козловский А.Н., «АстроКА», 2023 год, 88 стр.

Ежегодник (эта версия адаптирована для печати и для просмотра на экране монитора), составленный с использованием программ Guide 8.0 <http://www.projectpluto.com>, <http://www.calsky.com/>, Starry Night Backyard 3.1, Occult v4.0, описывающий **избранные** астрономические явления, которые должны произойти в 2031 году. Календарь содержит эфемериды Солнца, Луны, больших планет, комет и астероидов, доступных для наблюдений любительскими средствами (биноклями и небольшими телескопами). Кроме этого, даны карты-схемы солнечных и лунных затмений, приведены сведения о покрытиях звезд и планет Луной, метеорных потоках и т.п. О явлениях других лет расскажет Астрономический календарь - справочник от 1901 до 2100 года <http://www.astronet.ru/db/msg/1374768>. Целью данного календаря является охват многих явлений года, представленных, по большей части, в виде таблиц, для последующего определения подробных обстоятельств явлений при помощи программ-планетариев. Но, при желании, можно ограничиться только данным календарем, для уточнения дат тех или иных явлений. Более подробное освещение явлений будет ежемесячно и еженедельно даваться в Календаре наблюдателя и Астрономической неделе на [Астронет](http://astronet.ru) <http://astronet.ru>. Следите за обновлениями!

Для наблюдателей, членов астрономических кружков, любителей астрономии, студентов, преподавателей школ и ВУЗов.

## Уважаемые любители астрономии!

Надеюсь, что АК-2031 послужит Вам надежным спутником при астрономических наблюдениях. В серии «Астробиблиотека» вышли книги: «Астрономический календарь на 2005 (2006 - 2030) годы», «Астрономический календарь - справочник от 1901 до 2100 года», «Солнечное затмение 29 марта 2006 года (1 августа 2008 года) и его наблюдение», «Кометы и методы их наблюдений», «Астрономические хроники: год 2004 (2005 - 2007)», «Противостояния Марса». Скачать их можно на <http://astronet.ru>. Автором выпускаются также периодические издания: журнал «Небосвод» и «Календарь наблюдателя» (выкладка ежемесячно на <http://astronet.ru>). Искренне Ваш. Козловский А.Н.

## О счете времени

В настоящем выпуске Астрономического Календаря моменты явлений, за исключением особо оговариваемых случаев, даются по **всемирному времени**. Переход от одной системы счета времени к другой выполняется по формулам  $UT=Tm - \lambda$ ,  $Tp = UT+n(\text{ч})=Tm+n(\text{ч}) - \lambda$ . В этих формулах  $UT$  - всемирное время;  $Tm$  - местное среднее солнечное время;  $Tp$  - поясное время;  $n(\text{ч})$  - номер часового пояса (на территории России к номеру часового пояса прибавляется еще 1 час декретного времени);  $\lambda$  - географическая долгота в единицах времени, считающаяся положительной к востоку от Гринвича.

Поясное время второго часового пояса, в котором расположена Москва, называется московским временем и обозначается  $Tm$ . Поясное время других пунктов на территории РФ получается прибавлением к московскому времени целого числа часов  $\Delta T$ , которое равно разности номеров часового пояса данного пункта и часового пояса Москвы:  $T=Tm + \Delta T$ .

В весенне-летний период на территории России до 2011 года вводилось летнее время, т. е. все часы переводились на один час вперед. Перевод осуществлялся в два часа ночи последнего воскресенья марта.

В начале осенне-зимнего периода, в три часа ночи последнего воскресенья октября, часы снова переводились на один час назад: вводилось зимнее время. Таким образом, в весенне-летний период время было  $Tm=UT+4^{\text{ч}}$  и  $T=Tm-\lambda+4^{\text{ч}} + \Delta T$ , в осенне-зимний период  $Tm=UT+3^{\text{ч}}$  и  $T=Tm-\lambda+3^{\text{ч}} + \Delta T$ .

В 2011 году стрелки часов перевелись в марте на летнее время, и это время было оставлено основным, т.е. переход на зимнее время не осуществлялся. Поэтому разница по времени с Гринвичем стала постоянной в течение всего года и составляла для Москвы 4 часа.

Но в 2014 году 26 октября постановлением Правительства РФ стрелки часов вновь перевелись на 1 час назад. Тем самым, страна вернулась к зимнему времени, а разница с Гринвичем сократилась для Москвы до 3 часов. Таким образом, поправка по времени стала вновь вычисляться по формулам  $Tm=UT+3^{\text{ч}}$  и  $T=Tm-\lambda+3^{\text{ч}} + \Delta T$ .

Моменты восходов и заходов светил в данном календаре даны для пункта с координатами **0 градусов долготы и 56 градусов северной широты** (для удобства перерасчета моментов восходов и заходов светил для любых других населенных пунктов). Зная по данному АК моменты восходов и заходов светил и наступления других явлений, вы можете вычислить или уточнить время события в вашем пункте при помощи программ-планетариев или из непосредственных наблюдений.

В АК\_2031 счет времени ведется по Григорианскому календарю.

## Краткий обзор явлений 2031 года

2031 год будет **интересным** в отношении затмений и покрытий Луной планет и ярких звезд. Главными астрономическими событиями 2031 года будут **кольцеобразное и кольцеобразно-полное солнечные затмения**, а также **полутеневые лунные затмения**, видимые на территории нашей страны. Лунные затмения придутся на майское, июньское и октябрьское полнолуние, а солнечные будут наблюдаться в майское и ноябрьское новолуние.

**Первое затмение 2031 года будет полутеневым лунным.** Оно произойдет при полнолунии 7 мая, а его видимость распространится на территорию Африки, Европы, Америки, Австралии и Антарктиды. Максимальная фаза затмения составит 0,907, а Луна пройдет через южную часть полутени Земли. В России и СНГ затмение будет видно лишь в самых западных ее районах. Полутеневая фаза затмения продлится около четырех часов. Луна во время затмения будет находиться в созвездии Весов.

**Второе затмение 2031 года будет кольцеобразным солнечным и** произойдет при новолунии 21 мая, а фазы этого затмения будут наблюдаться на территории СНГ. Максимальная фаза затмения составит 0,959. В центре полосы затмения солнечное кольцо будет наблюдаться в течение 5 минут 26 секунд. Кольцеобразная фаза будет наблюдаться в Африке, Индии и Индонезии. Солнце и Луна во время затмения будут находиться в созвездии Тельца.

**Третье затмение 2031 года будет полутеневым лунным.** Оно произойдет при полнолунии 5 июня, а его видимость распространится на тихоокеанский регион. Максимальная полутеневая фаза затмения составит 0,154, а Луна пройдет через северную часть полутени Земли (весьма далеко от края земной тени). Полутеневая фаза затмения продлится менее двух часов. Луна во время максимальной фазы затмения будет находиться в созвездии Змееносца.

**Четвертое затмение 2031 года будет полутеневым лунным.** Оно произойдет при полнолунии 30 октября, а его видимость распространится, на восточную половину нашей страны. Максимальная полутеневая фаза затмения составит 0,74, а Луна пройдет через северную часть полутени Земли. Все фазы затмения будут наблюдаться на Дальнем Востоке, а также в тихоокеанском регионе. Полутеневая фаза затмения продлится около четырех часов. Луна во время максимальной фазы затмения будет находиться в созвездии Овна.

**Пятое затмение года будет кольцеобразно-полным солнечным и** произойдет в новолуние 14 ноября. Наблюдаться это затмение будет в разных фазах в тихоокеанском регионе. Центральная полоса затмения, практически вся будет проходить по Тихому океану. Лишь конец полосы заденет Центральную Америку. Максимальная фаза затмения составит 1,011. Максимальная продолжительность полной фазы затмения 1 минута 8 секунд будет иметь место в центральной части Тихого океана. В нашей стране затмение наблюдаться не будет. Солнце и Луна во время затмения будут находиться в созвездии Весов.

Информация об этих затмениях будет постепенно публиковаться на Астронет <http://www.astronet.ru> и Астрофоруме <http://astronomy.ru/forum/> в теме Астрономические наблюдения. **Статьи** о солнечных и лунных затмениях ранних лет имеются в журнале Небосвод на <http://www.astronet.ru>.

**Видимость планет в 2031 году достаточно благоприятна. Меркурий** в течение года достигнет 4 утренних (январь, май, август, декабрь) и 3 вечерних (март, июль, ноябрь) элонгаций, не отходя от Солнца более чем на 28 градусов. Лучшая вечерняя элонгация быстрой планеты для нашей страны будет в марте, а лучшая утренняя - в августе.

Для **Венеры** в 2031 году благоприятным временем для наблюдений будет первая половина года (2 июня - максимальная вечерняя элонгация 47 градусов). Для **Марса** благоприятное время для наблюдений - это первая половина года. 5 мая планета вступит в противостояние с Солнцем. Наилучшая видимость **Юпитера** (созвездия Змееносца и Стрельца) относится к первой половине года (противостояние с Солнцем 15 июня). **Сатурн** (созвездие Тельца) также лучше всего виден близ противостояния 11 декабря. **Уран** (созвездие Тельца) и **Нептун** (созвездие Рыб) вступают в противостояние с Солнцем, соответственно, 17 декабря и 7 октября.

**Из соединений планет друг с другом в 2031 году самым близким** будет соединение Венеры и Нептуна до 53 угловых минут 1 марта. Из других соединений (менее градуса) будет иметь место соединение Меркурия и Урана, но близко к Солнцу. Соединения других планет можно найти в календаре событий АК\_2031.

**Среди покрытий Луной больших планет Солнечной системы в 2031 году:** Меркурий покроется 3 раза (24 марта, 17 августа и 17 октября), Венера - 2 раза (26 марта и 13 сентября), Марс - 3 раза (2 и 30 июня и 28 июля) и Юпитер 1 раз (20 января). Покрытия Сатурна начнутся с 24 апреля и продолжатся до конца года. Уран и Нептун в этом году не покроются Луной ни разу.

**Из покрытий Луной ярких звезд** покрытие звезды Антарес произойдет в следующий раз только 13 марта 2042 года. Покрытия звезды Альдебаран (альфа Тельца) придется ждать до 18 августа 2033 года, покрытия звезды Регул (альфа Льва) - до 11 июня 2035 года, а покрытия звезды Спика (альфа Девы) начнутся 12 февраля 2031 года и продолжатся до конца года ежемесячно (в июне - 2 раза).

**Среди астероидов Веста** станет самой яркой в этом году. Ее блеск 1 января составит 7,2m (созвездие Тельца). 31 декабря блеска 7,9m достигнет Церера (созвездие Льва). Сведения об этих других ярких астероидах публикуются ежемесячно в Календаре наблюдателя на <http://www.astronet.ru/>.

**Среди комет доступными для средних телескопов будут небесные** странницы: P/Tempel-Tuttle (55P), P/Giacobini-Zinner (21P) и P/Arend-Rigaux (49P), ожидаемый блеск которых составит около 12m и ярче. Следует отметить, что **приведенный список может значительно меняться**, ввиду открытия новых комет и увеличения блеска ожидаемых, а также потерь известных комет.

**Из метеорных потоков** лучшими для наблюдений будут Лириды, Леониды и Геминиды.

Оперативные сведения об астрономических явлениях и многочисленные ссылки на интересные астроресурсы можно всегда найти на Астронет <http://www.astronet.ru/> в Календаре наблюдателя и Астрономической неделе.

**Ясного неба и успешных наблюдений в 2031 году!**

**Пояснение для эфемерид Солнца и Луны:** Д – дата на 0 часов всемирного времени,  $\alpha$  (2000.0) и  $\delta$  (2000.0) – прямое восхождение и склонение для эпохи 2000.0, созв – созвездие в котором находится светило на 0 часов UT, блеск – звездная величина, диам – видимый диаметр в минутах дуги, восход – восход светила, ВК – время верхней кульминации, Вс – высота над горизонтом в верхней кульминации, заход – заход светила, расст – расстояние в км от Земли до Луны. Сверстано при помощи <http://www.calsky.com/> и Guide 8.0

|                |                 | Dec 28 17:33   |                |

Данные с сайта <http://sunearth.gsfc.nasa.gov> Отмечены даты солнечных и лунных затмений.

A - кольцеобразное солнечное, H - кольцеобразно-полное солнечное, n - полутеневое лунное.

## Луна в перигее и апогее (UT)
