We present a new Name-List of variable stars containing information on 1610 variable stars in 31 globular star clusters, in four constellations (Pavo – Sagittarius), that now get their names in the system of the General Catalogue of Variable Stars (GCVS). Also, GCVS names are assigned to 6 recent Novae and one young variable star in our Galaxy.

1 INTRODUCTION

This Name-list of variable stars is the fourth part of our list of variable stars in globular clusters (the first three parts appeared in Kazarovets et al. 2019 and Samus et al. 2020, 2021 and contained 3421 stars in 67 clusters, belonging to 24 constellations from Apus to Ophiuchus). Compilation of such lists in the format of the General Catalogue of Variable Stars (GCVS; Samus et al. 2017) became possible after determination of equatorial coordinates for a large number of variable stars in globular clusters (Samus et al. 2009) and introduction of equatorial coordinates into new versions of the electronic Catalogue of variable stars in galactic globular clusters (CVSGGS; Clement et al. 2001).

As usual, we also take the opportunity of the present Name-list to announce new GCVS names for 6 Novae discovered in 2024. Besides, we assign a GCVS name to an unusual young variable star in Vulpecula.

2 THE NAME-LIST

This publication, the 86th Name-List of Variable Stars, contains information on 1610 variable stars in 31 galactic globular clusters newly named in the system of the GCVS (Samus et al. 2017). The clusters, selected in alphabet order of the constellations they belong to, are from 4 constellations (Pavo, Pegasus, Sagitta, and Sagittarius), Sagittarius being the constellation richest in globular clusters in the sky.

As mentioned in the Introduction, this work became possible only when equatorial coordinates had been determined by Samus et al. (2009) for all globular-cluster variable stars contained in the Clement et al. (2001) catalogue (CVSGGC) by that time. Since

then, the CVSGGC was considerably appended. Fortunately, the authors of new discoveries and of new thorough investigations now use to present equatorial, rather than rectangular, coordinates in their publications. We are now able to check the coordinates using the Gaia DR3 catalogue (Gaia Collaboration et al. 2023); even in the dense fields of globular clusters, Gaia coordinates are available for a vast majority of variable stars.

Many variable stars in globular clusters are faint, some of them are in rather crowded fields. Nevertheless, in some cases, we were able to check photometric information and/or to derive new light elements. For this purpose, we mainly used the ASAS-SN (Shappee et al. 2014; Kochanek et al. 2017), Catalina (Drake et al., 2009) databases. In the current Name-list, there are cases where we used observations from ZTF DR 17 object viewer (Malanchev et al. 2022). This facility has a very good limiting magnitude and excellent angular resolution but, unfortunately, is restricted to northern or only moderately southern declinations. In total, improving light elements was possible for 509 stars (32% of all stars in the current Name-list, which exceeds the percentage of new light elements in our previous Name-lists for globular-cluster variables).

In a number of cases, the CVSGGS mentioned field variable stars not included into the CVSGGS but originating from the same publications. We decided to keep these stars in the present Name-list.

Like in the previous Name-lists, we separate the catalogue of newly designated variables (it will be presented at the GCVS web site) from the Name-list. Table 1 of the present Name-List contains the new GCVS names, CVSGGS names (or, if not available, names from other sources), equatorial coordinates (rounded to an accuracy sufficient for identification), and variability types for each of the 1610 stars included into the Name-list. The order of clusters in Table 1 corresponds to the order of right ascensions of the first star of the corresponding cluster in the Name-list; there are so many globular clusters in Sagittarius that right ascensions within different clusters overlap, causing discontinuities in the GCVS names in some clusters. Other data will be presented at <http://www.sai.msu.su/gcvs/gcvs/nl86> and in the tables of the GCVS proper (<http://www.sai.msu.su/gcvs/gcvs/>), where we will additionally give variability ranges, light elements, spectral types (if available), identifications with astronomical catalogues, detailed remarks, bibliographic references for the newly named variable stars, accurate coordinates and proper motions (with references to corresponding positional catalogs or sources in the literature).

Table 2 announces GCVS names for 6 recent, spectroscopically confirmed Novae in our Galaxy and for an unusual, EX Lup-like young star V0614 Vul. It contains the GCVS names, Nova (or variable star's) names, and J2000.0 coordinates.

The total number of named variable stars, not counting designated non-existing stars or stars subsequently identified with earlier-named variables, is now 60 719.

Acknowledgments: We gratefully acknowledge the use of the Catalina (Drake et al. 2009), ASAS-SN (Shappee et al. 2014; Kochanek et al. 2017), and ZTF DR 17 (Malanchev et al. 2022) databases. Thanks are due to V.P. Goranskij for supplying information on V0614 Vul. We are also very grateful to him for his period-search software WinEfk that our team successfully uses for many years.

This work has made use of data from the European Space Agency (ESA) mission Gaia, processed by the Gaia Data Processing and Analysis Consortium (DPAC). Funding for the DPAC has been provided by national institutions, in particular the institutions participating in the Gaia Multilateral Agreement.
